

Acknowledgments

This supplement was funded by the National Highway Traffic Safety Administration (NHTSA). We are grateful for the support of Richard Compton, Director of Research and Technology at NHTSA, in facilitating this award.

The feature papers in this supplement evolved from a May 2006 workshop convened by the Committee on Contributions from the Behavioral and Social Sciences in Reducing and Preventing Teen Motor Crashes, a project of the Board on Children, Youth, and Families and the Transportation Research Board, under the auspices of the National Research Council and the Institute of Medicine. The workshop involved multidisciplinary experts who shared information and insights on topics ranging from adolescent development to emerging technology for studying, monitoring, and controlling driving behavior. The program was structured to bring together researchers who had not addressed studies of teen driving, but who might have unique insights in the field of adolescent development, public health, and social and behavioral research, with experts who have deep experience in the field of highway safety. Presenters highlighted selected policy and research issues, identified challenges in using research to guide federal and state policies, and explored implications of the data presented and future opportunities.

The Committee's work was funded by The Office of Behavioral and Social Science Research (OBSSR) in the National Institutes of Health, the National Center for Injury Prevention and Control at the Centers for Disease Prevention and Control (CDC), and the State Farm Insurance Foundation. We are grateful for the guidance of David Abrams from OBSSR, Bruce Simons-Morton from the National Institute for Child Health and Human Development, Ruth Shults from CDC, and John Nepomuceno from State Farm who offered encouragement during this activity.

Thank you to NRC/IOM staff members Jennifer Appleton Gootman who coordinated the development of this supplement, as well as Rosemary Chalk, Wendy Keenan, and Dianne Wolman for their assistance in all stages of this project, and to Hugh McIntyre, who assisted with the editing of these papers.

Great appreciation is extended to the internal editorial committee—Allan Williams, Richard Catalano, Daniel Mayhew, Susan Millstein, and Ruth Shults—who worked tirelessly with the authors to review and prepare the papers for publication. We also wish to thank the AJPM staff for their support and guidance.
